

Arsenic Removal by Graphene Oxide-Nanoscale Zero-valent Iron Hybrid

Tonoy K Das

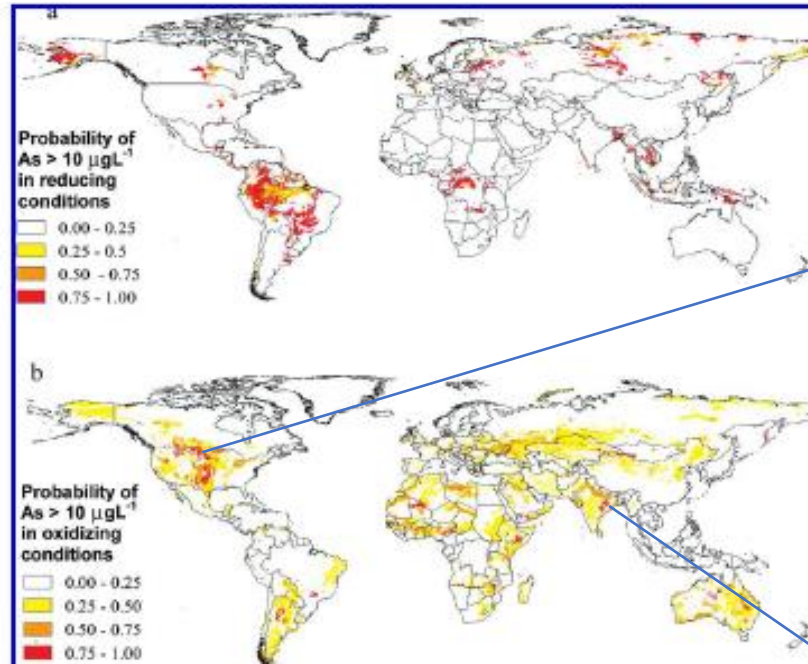

Achintya N. Bezbaruah

**Nanoenvirology Research Group, Department of Civil and Environmental Engineering,
North Dakota State University**

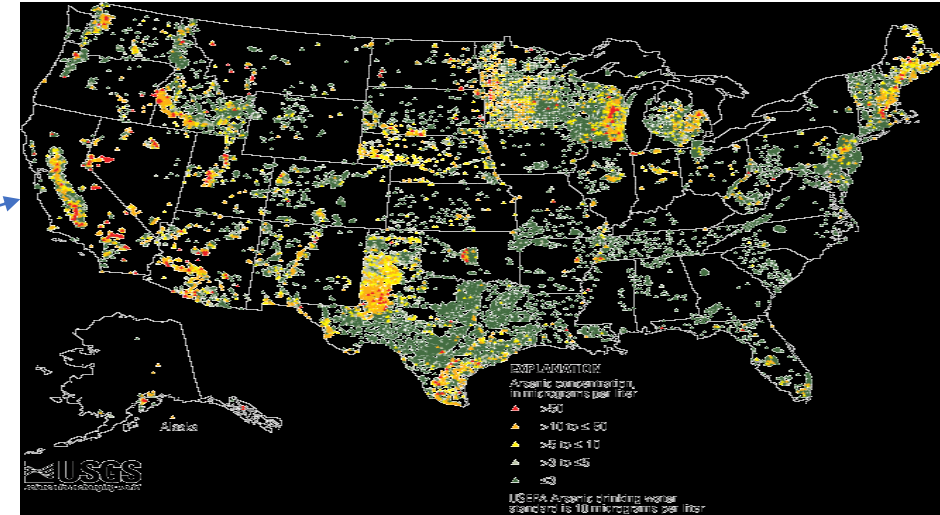

Outline

- **Arsenic contamination**
- **Concept of graphene oxide based material**
- **Material synthesis and characterization**
- **Arsenic Removal and Mechanisms**
- **Desorption Study**
- **Conclusion**

Global Contamination

Global Status Amini et al. 2008

USA Status (USGS, 2014)

India and Bangladesh

Concept of Graphene Oxide Based Composites

- Platform to build new adsorbents
- Two basal planes available
- High dispersion

Research Background

- ❖ Arsenic (As) is toxic, carcinogenic, non-biodegradable, and persistence metalloid
- ❖ MCL in drinking water 10 $\mu\text{g/L}$ (WHO)
- ❖ Adsorbent with high adsorption capacity and selectivity
- ❖ Iron nanoparticles (Fe NPs) show high selectivity to As
- ❖ Fe NPs is highly agglomerate
- ❖ Graphene oxide is single layer structure of carbon having high stability and negatively charged surface

Objectives

- ❖ Evaluation of graphene-supported Fe NPs and conventional Fe NPs for arsenic removal and their possible mechanisms.
- ❖ Effectiveness under different environmental conditions
- ❖ Desorption pattern

Arsenate

Arsenite

Synthesis Pathway of Graphene-Fe Hybrid

Graphene oxide magnetite (GM)

Graphene oxide nanoscale zerovalent iron (GNZVI)

(Adopted from Li *et al.*, 2014)

Material Characterization

Graphene Oxide

NZVI

GNZVI

Material Characterization

Magnetite

GM

Advantages of Graphene-Oxide Supported Fe-Nps

- Less agglomeration
- Better exposure to Arsenic Solution
- Higher Removal

As Removal by Batch Study

As(V)

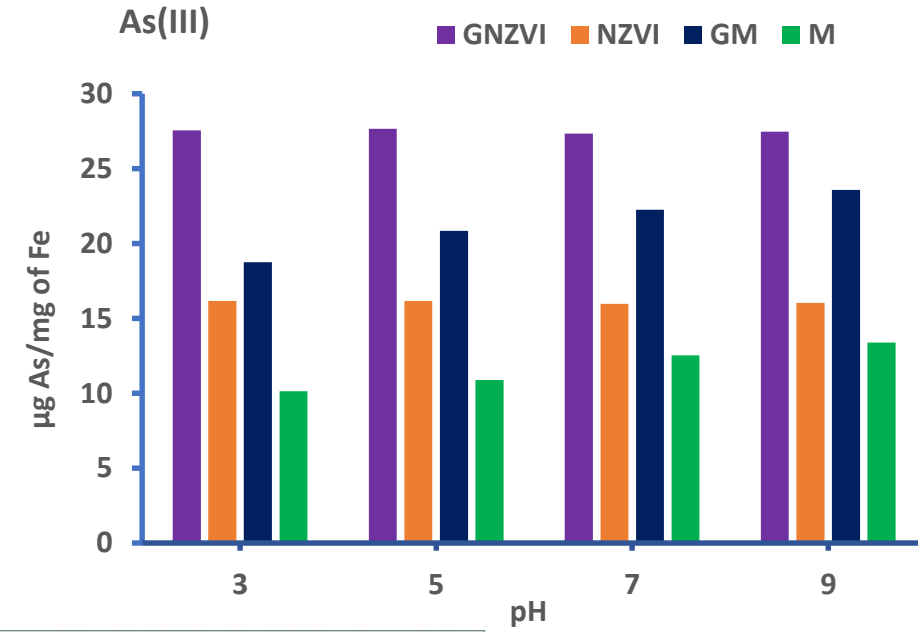

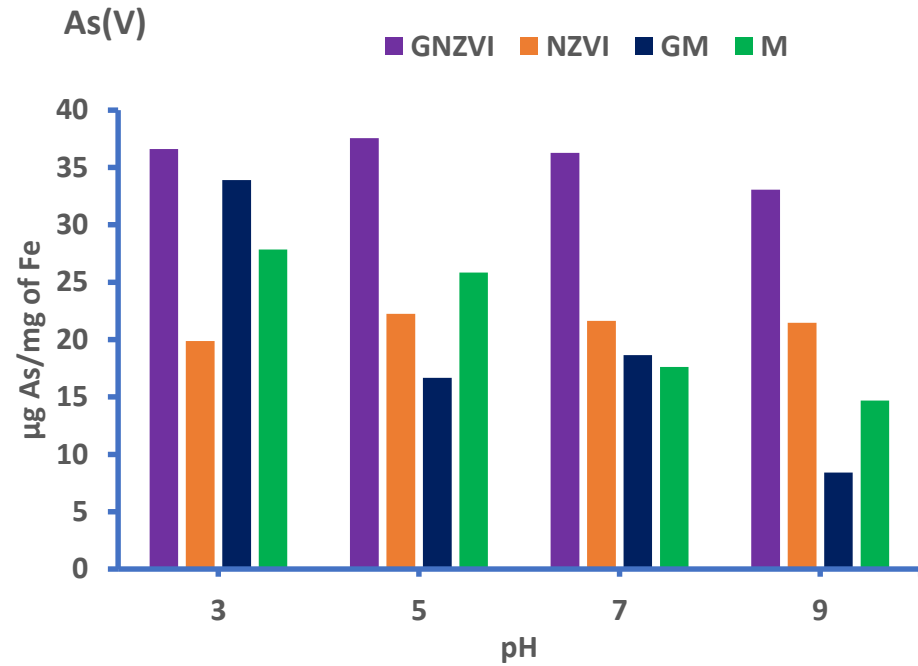

As(III)

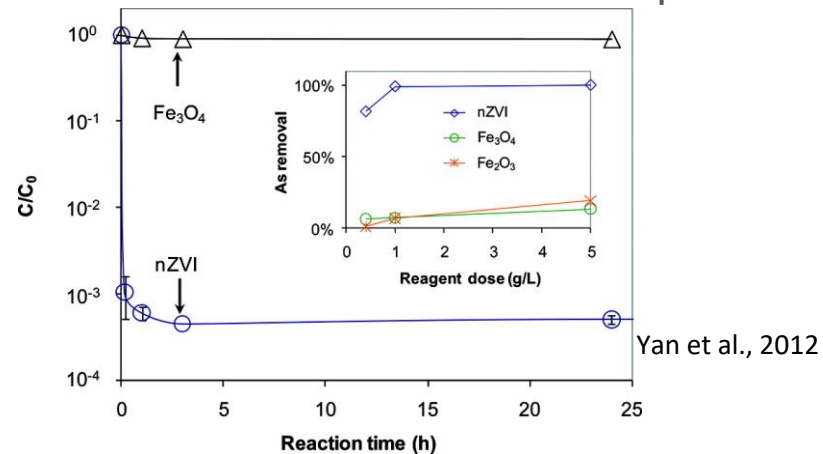

$C_0 = 5 \text{ mg/L}$

Adsorbent: 250 mg/L

Arsenic Removal on Fe Content Basis

In 10mg	mg Fe
• GNZVI	5.545
• NZVI	9.5
• GM	5.45
• M	7.27

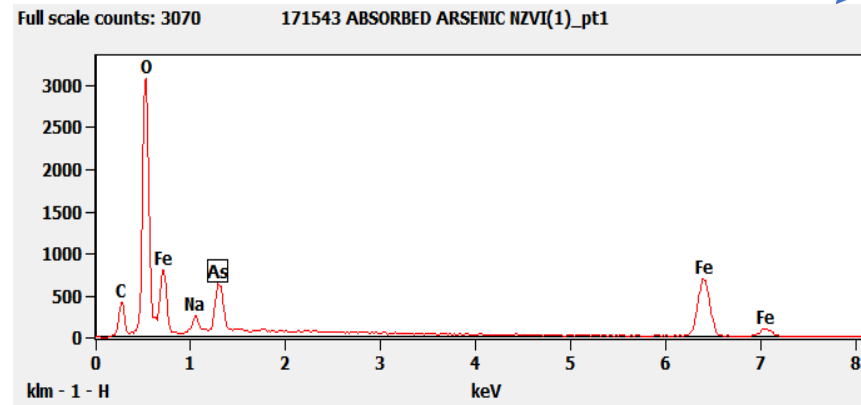

Zeta Potential (mV) and Point of Zero Charge

Adsorbent	Mean	pH
GO	-48.50±0.33	8.70
GNZVI	-22.97±0.90	8.58
GNZVI+As	-38.13±0.98	8.79
NZVI	11.67±0.87	8.9
NZVI+As	7.26±0.47	8.85
GM	-10.76±0.87	7.78
GM+As	-26.70±0.24	4.77
M	8.27±1.19	8.01
M+As	-14.07±0.71	4.38

Adsorbed Arsenic in GNZVI

Mechanisms for GNZVI

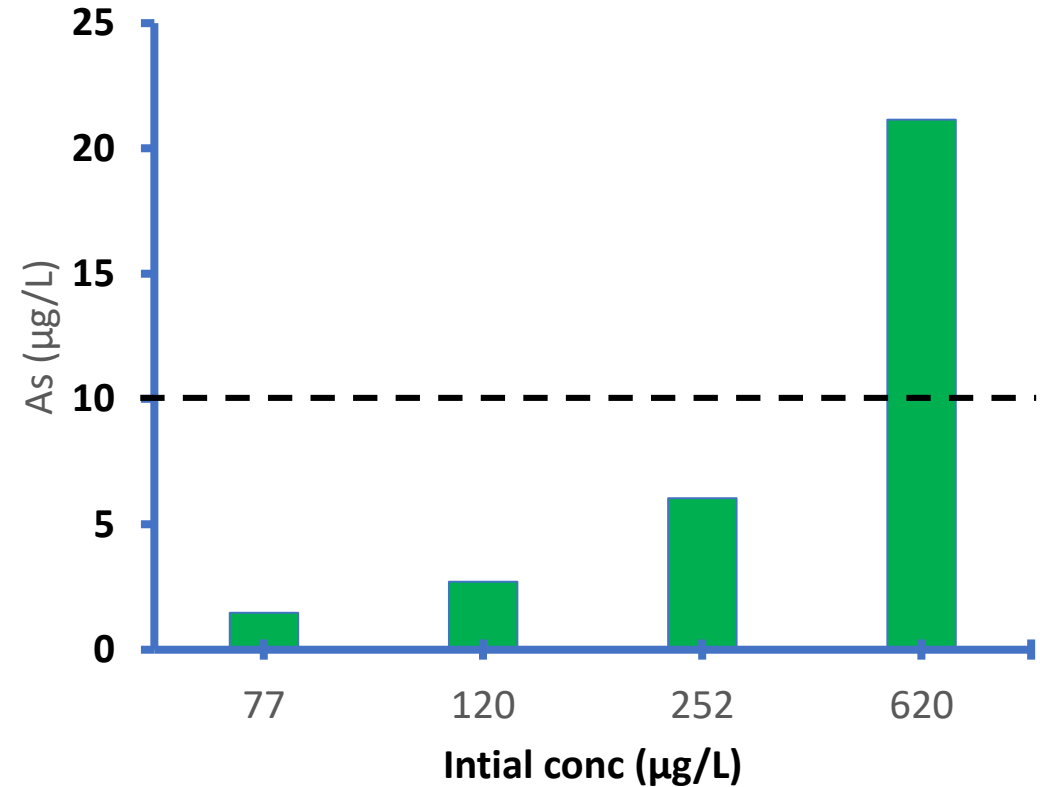

Bezbaruah et al, 2014

Adsorption Isotherm of GNZVI

	Langmuir		Freundlich	
As(V)	q_m (mg/g)	384.62	n	1.779
	K_1 (L/mg)	0.092	k_f	20.649
	R^2	0.9814	R^2	0.9617
As(III)	q_m (mg/g)	294.12	n	2.15
	K_1 (L/mg)	0.084	k_f	24.31
	R^2	0.99	R^2	0.8672

Low Concentration Removal

Interferences on As(V) removal by GNZVI

Desorption of Arsenic from Nano-Composite

Release in DI Water

Adsorbed As: 110 µg /mg of GNZVI

Release in Synthetic Groundwater

Sequential Extraction

Extractant	Target phase
MgCl ₂	ionically bound As
Phosphate	strongly adsorbed As
Oxalic acid	As coprecipitated with amorphous Fe oxyhydroxides
HNO ₃	As coprecipitated with crystalline Fe oxyhydroxides

Keon, 2001

GNZVI

Conclusions

- ❖ Graphene oxide iron nanocomposites having better removal
- ❖ The GNZVI recorded high adsorption capacity
- ❖ Works effectively under variable environmental condition
- ❖ Low As desorption from adsorbed phase

Arsenic Contamination- Public Health

- Arsenic Group 1 Carcinogen (WHO)
- > 300 million worldwide.
- 13 million : USA; 70 million : Bangladesh (Murcott 2012).
- **Acute effects:** vomiting, abdominal pain and diarrhea lead to numbness and tingling of the extremities, muscle cramping and death
- **Long-term effects:** skin lesions precursor to skin cancer, cancers of the bladder and lungs, developmental effects, neurotoxicity, diabetes, pulmonary disease and cardiovascular disease, adverse pregnancy outcomes and infant mortality, with impacts on child health

Information

- Reduction potential of nZVI & As(V)-to-As(0) -0.447 V (Fe/Fe(II)), and $.0499$ V. The reduction of As(V) thermodynamically possible
- The first step in removing arsenic from water entails the convective transfer and/or molecular diffusion of dissolved arsenate from the bulk solution to the nZVI–water interface. Arsenate is attracted to the surface by electrostatic interactions as both arsenate and the iron surface are charged, and via ligand exchange that replaces a surface-bonded -OH group ($>Fe-OH$) with an arsenate ion. This constitutes the outer ring observed on the arsenic mapping. The surface-bound As(V) continues to diffuse through the surface layer. Further penetration or diffusion of As(V) is induced by its reduction to As(III) and As(0), and the latter accumulates at the Fe(0)– oxide interface
- Fe(III) oxide near the particle–water interface to mixed Fe(II)/Fe(III) oxides close to the core. The surface of the oxide layer contains hydroxide groups after being exposed to water and has acid–base chemistry similar to that of iron oxides in water. Measurements show that the nZVI has a zerocharge pH or pH_{zpc} at ~ 8.2 . Thus, it can attract and/or adsorb As(V) or As(III) via electrostatic attractions or ligand exchanges that replace surface-bonded OH groups ($>Fe-OH$) with arsenate ions.
- The presence of oxygen vacancies and lattice disorder could give rise to elevated charge transfer and ionic mobility at room temperature.
- For nZVI, the maximum As(III) loading capacity is 2.2 mM As/g, while the value of the oxides is no more than 0.17 mM As/g. As a firstorder estimate in which we consider that the average As(III) adsorption density on an iron oxide surface is ~ 3 sites/nm², one can estimate that the maximum As(III) uptake by the iron oxides is ~ 0.2 mM As/g, which is consistent with the experimentally observed capacities. On the other hand, the capacity of arsenite removal by nZVI is well in excess of the total surface adsorption sites available, indicating that arsenite was not retained as merely a surface adsorbed layer
